[Team Dashboard](#)

Overview

Build with AI: Code for Communities is a Google Cloud hackathon that brings together developers from across India to build AI-powered solutions for the challenges that matter most, right here at home. Healthcare supply chains. Climate resilience. Food security. Digital public infrastructure. Problems India's own cities, states, and communities face every day — and need builders to help solve.

This hackathon is built around one theme: **solving for India**. Solutions designed by Indian developers, for Indian problems, at Indian scale.

The in-person Demo Day will happen in **October**. More details will be shared with shortlisted teams.

Why participate

Your solution could go national.

[Select Language ▼](#)[Home](#)[Blogs](#)[My Dashboard](#)**matter.**

Winning teams will showcase their solutions in person to industry experts.

GDG India's network hosts technical bootcamps and skilling sprints across cities before submissions close — in-person sessions on Google Cloud AI tools & technologies.

teams.

Top teams will receive GCP credits so that you're focused on building, not worrying about infrastructure.

Cash prize pool:

INR 10 lakhs

A network that extends beyond the hackathon.

Who can participate

[Select Language ▼](#)[Home](#)[Blogs](#)[My Dashboard](#)

developers, AI/ML practitioners, product thinkers, freelancers — students, professionals across India, and startups

Team size:

up to 4 members per team

Cost:

free to register

Solo registrants are also welcome

Problem statements

01**AI for Digital Public Infrastructure & Governance****THEME: INNOVATION**

03

Smart Health & Supply Chain Resilience

THEME: RESILIENCE

THE PROBLEM

Public healthcare systems across India face persistent supply chain vulnerabilities. The inability to track medicines, patient footfall, and resource utilisation in real time across vast networks of Primary Health Centres leads to stock-outs and limits the country's capacity to respond when it matters most.

THE CHALLENGE

Build a federated AI platform for national-scale health resource and supply chain management — real-time visibility into medicine stocks, bed availability, and medical personnel attendance across India's entire PHC network. It should forecast demand, generate early warnings for potential stock-outs during health emergencies, and recommend automated cross-district resource redistribution, while allowing for shared predictive modelling across India's states.

What to build & what to submit

[Overview](#) [Why participate](#) [Who can participate](#) [Problem statements](#) [What to build & what to submit](#) [Timeline](#) [In-person](#) >

concept

Your submission needs to demonstrate real, working functionality — and arrive as a complete package judges can evaluate end to end.

Build

Submissions must demonstrate all of the following:

- ✓ A functioning end-to-end flow for your track's core use case

Submit

Submission package:

- 1 Source code — public or access-granted GitHub repository

Build with AI: Code for Communities — Second Edition

computer vision etc

- ✓ Real or realistic data — public datasets, sample data, or APIs where live data isn't available
- ✓ Built for India — the solution should be designed to scale across states and communities, not just a single city
- ✓ Multilingual or voice support where the track calls for it

3 Pitch deck (10–12 slides) — problem, solution, AI approach, who it serves, why it's deployable, how it scales across India

4 Brief description — small description of your solution in 2-3 lines

5 Deployed link — A live deployed link of your prototype

Tools & tech to build with

All solutions must integrate Google AI. The following are recommended and fully supported:

Generative AI & agents

Gemini API, Google AI Studio, Vertex AI

[Select Language ▼](#)[Home](#)[Blogs](#)[My Dashboard](#)

Vertex AI platform, custom training, model serving,

Vision & multimodal

Gemini multimodal, Vertex AI Vision (for citizen photo analysis, crop disease detection, pollution monitoring)

Language & voice

Cloud Speech-to-Text and Text-to-Speech, Translation API, Dialogflow (for multilingual and voice-first interfaces across India's linguistic regions)

Geospatial

Google Maps Platform, Google Earth Engine (for satellite imagery in climate and agriculture tracks)

Data & backend

BigQuery (for large-scale national datasets), Firebase (auth, real-time DB, rapid prototyping), Cloud Run / Cloud Functions

Blogs

My Dashboard

data.gov and many government open data portals, 170 agricultural datasets, WHO health data, ISRO/Bhuvan satellite data, IMD and national meteorological services

Organizers: confirm Google AI Studio and Vertex AI credit details for registered teams.

Evaluation parameters

Submissions will be judged across five criteria, ranked here by weight.

20%**Problem-Solution Fit**

Does it directly and specifically address the stated challenge?

+

25%**AI/Technical Execution**

Is Google AI doing meaningful work? Does the prototype function end-to-end?

+

20%**Depth & Reach Across India**

Can this realistically scale from one city or state to communities across India?

+

15%**Impact Potential****20%****Deployability & Scalability**

TBA

VENUE

TBA

You won't be building this alone.

GDG Skilling Sprints — in-person weekend bootcamps hosted across multiple cities by GDG India, covering several Google Cloud AI tools & technologies.

Attend a GDG

Attend a GDG in-person workshop in a city near you

Before you build, get hands-on. GDG chapters across India are hosting in-person workshops and skilling sprints on Google Cloud AI tools — Gemini, Vertex AI, and more — to help you walk into the hackathon ready to build, not just ready to register.

Find the GDG chapter closest to you and reserve your spot before workshops fill up.

Can't find a workshop in your city? Look for a nearby city.

City-wise workshop schedules will be published later in August — keep an eye on the website and your registered email address.

Rules & Guidelines

- 01** All solutions must integrate **Google AI** — GenAI, predictive modelling, or computer vision. Submissions without Google AI integration will not be considered.
- 02** Teams must **build during the hackathon period**. Pre-existing projects are not eligible unless substantially extended for this challenge.
- 03** All code must be **original** or built on properly licensed open-source components — cite anything you reuse.
- 04** Solutions should be designed with **cross-border applicability** in mind — built for one context but scalable to others across BRICS nations.

06 Judges' decisions are final.

FAQs

Do I need government or policy experience to participate? 

No. Pick the track that matches your skills and interests. Domain context, ground-level briefs, and mentorship will be provided throughout. You need to be able to build — the policy context is something you'll absorb as you go.

Does my solution need to work across all of India? 

It needs to be designed with scalability in mind — the core system architecture should be scalable beyond a single city or state. It doesn't need to be fully localised for every state at the prototype stage, but judges will evaluate whether it could be.

Do I need to use Google AI? 

Yes — integration of Google AI (GenAI, predictive modelling, or computer vision) is

[Select Language ▼](#)[Home](#)[Blogs](#)[My Dashboard](#)

What happens if my solution is selected after the Demo Day?

Through official channels established with the government, winning solutions will be evaluated for pilot deployment within relevant ministries. Specific terms, timelines, and data access will be shared with selected teams before any commitments are finalised.

Will teams receive Google Cloud credits?

Top teams will receive Google Cloud credits.

Can I participate solo?

You can register individually and find teammates through the community channel, or build solo if you're confident covering the full scope. Teams of up to 4 members are recommended.

Is there a registration fee?

Free to register.
